CLINICAL RATIONALE

Hemophilia A	Hemophilia A, also called Factor VIII (FVIII) deficiency or classic hemophilia, is a genetic disorder caused by missing or defective Factor VIII (FVIII), a clotting protein. Although it is passed down from parents to children, about 1/3 of cases found have no previous family history.(19)
--------------	--

Treatment for hemophilia A is dependent on several factors and there is not a universal therapy that will work for all patients. Clinically the hallmark of bleeding in hemophilia is bleeding into the joints, muscles, and soft tissues. The severity and the risk of that bleeding can be correlated to the residual amount of factor activity that can be measured in the blood. Patients with severe disease have less than 1% residual activity, and often have zero. These are the patients who are at risk for spontaneous as well as traumatic bleeding. Having over 5% residual amount makes bleeding into the joints very unusual (although not inconceivable), and most bleeding is triggered only by trauma. Residual activity of 1-5% appears for the most part to prevent spontaneous bleeding, but patients can still be at risk for joint bleeds with even relatively minor trauma.(25)

The main goal of any therapy is to completely prevent bleeding. The current World Hemophilia Federation Guidelines for the Management of Hemophilia state:(26)

- Both virus-inactivated plasma-derived and recombinant clotting factor concentrates (CFCs), as well as other hemostasis products when appropriate can be used for treatment of bleeding and prophylaxis in people with hemophilia
- Prophylaxis is the standard of care for people with severe hemophilia, and for some people with moderate hemophilia or for those with a severe bleeding phenotype and/or a high risk of spontaneous life-threatening bleeding
- Episodic CFC replacement should not be considered a long-term option for the management of hemophilia as it does not alter its natural history of spontaneous bleeding and related complications
- Emerging therapies in development with alternative modes of delivery (e.g., subcutaneous injection) and novel targets may overcome the limitations of standard CFC replacement therapy (i.e., need for intravenous administration, short half-life, risk of inhibitor formation)
- The development of gene therapies for hemophilia has advanced significantly, with product registration likely in the near future
- Gene therapy should make it possible for some people with hemophilia to aspire to and attain much better health outcomes and quality of life than that attainable with currently available hemophilia therapies
- Given the ongoing advances transforming the hemophilia treatment landscape, it is important to establish systems to constantly monitor developments in emerging and gene therapies for hemophilia and make them available as soon as possible following approval by regulatory authorities

The National Hemophilia Foundation Medical and Scientific Advisory Council (MASAC) suggests the number of doses required for provision of home therapy varies greatly and is dependent upon the type of hemophilia (FVIII, FIX), the level of severity (severe, moderate, mild), the presence of an inhibitor, the prescribed regimen (on-demand, prophylaxis, immune tolerance), the number of bleeding episodes experienced regardless of the prescribed regimen, individual pharmacokinetics, the products utilized, and the level of physical activity. For patients on prophylaxis, a minimum of one major dose and two minor doses should be available in addition to the prophylactic doses utilized monthly. For patients with severe or moderate hemophilia treated on-demand, the number of doses required to be available at home may be based upon historical bleeding patterns, with at least one major and two minor doses added to assure a level of safety.(20)

A major dose is defined as a correction of clotting factor that achieves a level of 60-100+% clotting factor activity that is utilized to treat a bleeding episode that is expected to require a higher hemostatic level such as when bleeds occur in a target joint, or joint/area with a risk of significant sequelae (e.g., hip, head, GI bleed). A minor dose is defined as a correction of clotting factor that achieves a level of 30-60% clotting factor activity that is utilized to treat a bleeding episode that is treated early, in a non-critical area and treatable with a lower hemostatic level (e.g., early non-major joints, small muscle bleeds, and skin/soft tissue, etc.).(20)

Recombinant FVIII (rFVIII) products are treatment of choice for hemophilia A as recommended by MASAC. First generation rFVIII products contain animal and/or human plasma-derived proteins in the cell culture medium and in the final formulation vial (Recombinate). Second generation rFVIII products contain animal or human plasma proteins in the culture medium but not in the final formulation (Helixate, Kogenate). Third/fourth generation rFVIII products do not contain any animal or human plasma-derived proteins in the culture medium or in the final formulation vial.(22)

In view of the demonstrated benefits of prophylaxis (regular/scheduled administration of clotting factor concentrate to prevent bleeding) begun at a young age in persons with hemophilia A or B, MASAC recommends that prophylaxis be considered optimal therapy for individuals with severe hemophilia A (FVIII less than 1%). Prophylactic therapy should be instituted early (prior to the onset of frequent bleeding), with the aim of keeping the trough FVIII level above 1% between doses. Optimal dosing and frequency should be determined for each individual by appropriate laboratory monitoring. It is also recommended that individuals on prophylaxis have regular follow-up visits to evaluate joint status, to document any complications such as inhibitors, and to record any bleeding episodes that occur during prophylaxis.(21)

Approximately 1 in 5 people with hemophilia A will develop an antibody – called an inhibitor – to the clotting factor concentrate(s) used to treat or prevent their bleeding episodes. Developing an inhibitor is one of the most serious and costly medical complications of a bleeding disorder because it becomes more difficult to treat bleeds. Inhibitors most often appear in the first 50 exposure days of clotting factor concentrates.(25,27)

The National Hemophilia Foundation classifies inhibitors as low responding and high responding in addition to low titer (less than 5 BU) and high titer (greater than or equal to 5 BU). In low responding inhibitors when the patient receives Factor VIII the inhibitor titer does not rise. These patients can be treated with higher doses of the CFC. If the inhibitor titer increases with CFC it is considered high- responding. For high responding inhibitors, the situation becomes much more complicated as even large doses of infused CFC are often rendered ineffectual by the sheer potency of the antibody response.(26)

In the cases of high-responding inhibitors treatment is based on several components including the type of hemophilia and the nature of the bleed. During a life or limb-threatening bleeding episode, physicians can remove antibodies from the body using plasmapheresis. This is only a temporary solution however as within a few days the body will produce large amounts of new antibodies. For the person with a high responding inhibitor there are therapies that can effectively treat bleeds by

	<p>circumventing the need to replace FVIII. These agents are commonly referred to as bypassing agents (BPAs) and include activated prothrombin complex concentrate (aPCC) and recombinant activated Factor VII concentrates. Hemlibra, a therapy that does not function by FVIII or Factor IX replacement, is a newer therapy that can be used for these patients.(26)</p> <p>If left unchecked, a persistent inhibitor will present a severe burden on patients and families, as the ongoing physical, emotional, and in many cases financial toll continue to intensify. Healthcare providers will often attempt to proactively stamp out an inhibitor through immune tolerance therapy (ITI). ITI is an approach to inhibitor eradication where the body’s immune system begins to tolerate a therapy after daily doses of factor are administered over time. The majority of people who undergo ITI therapy will see an improvement within 12 month, but more difficult cases can take two years or longer.²⁷ There is a general consensus that failure of ITI is the inability to achieve successful tolerance within 2-3 years of initiation of an ITI regimen.(26)</p> <p>ITI can take several months to several years to be effective. The Hemophilia Federation of America recommends that if success has not occurred within 33 months of beginning ITT and there is a lack of a 20% decrease in the inhibitor titer over a 6 month period, that it is considered a failure.(23)</p> <p>Emicizumab-kxwh is a recombinant, humanized, bispecific immunoglobulin G4 monoclonal antibody that substitutes for part of the cofactor function of activated factor VIII (FVIII) by bridging activated factor IX and Factor X. Emicizumab-kxwh is indicated for routine prophylaxis to prevent or reduce the frequency of bleeding episodes in adults and children of all ages, newborn and older, with hemophilia A with and without Factor VIII inhibitors. There is significant reduction in annualized bleeding rates at all doses for all age groups, with or without inhibitors.(24)</p> <p>There is limited data on the concomitant use of emicizumab prophylaxis during ITI. There is a case series of children with hemophilia A and inhibitors who underwent ITI in combination with emicizumab prophylaxis (Atlanta Protocol), and a larger clinical trial of this protocol is underway [MOTIVATE study (NCT04023019)].²⁴ The MOTIVATE study is a non-interventional, multicenter, observational, international study in male persons with hemophilia A who have developed inhibitors to any replacement coagulation Factor VIII (FVIII product). The purpose of the study is to capture different approaches in the management and to evaluate the efficacy and safety of immune tolerance induction, including the combination of FVIII and emicizumab. Patient will be assigned to 1 of 3 groups based on the treatments they receive and may switch to another group if their treatment is changed. The 3 groups are:(30)</p> <ul style="list-style-type: none"> • ITI with Nuwiq, Octanate, or Wilate • ITI with Nuwiq, Octanate, or Wilate with emicizumab • Prophylaxis with emicizumab, aPCC, or recombinant FVIIIa without immune tolerance induction
von Willebrand disease	<p>von Willebrand disease (VWD) is a common, inherited bleeding disorder. VWD affects males and females equally in up to 1% of the population. There are several classification types of VWD which includes types 1 and 2 which are characterized by quantitative deficiencies of von Willebrand Factor (VWF) and types 2A, 2B, 2M, and 2N</p>

	<p>which are qualitative variants. Clinically, VWD patients experience several symptoms including: (32)</p> <ul style="list-style-type: none"> • Excessive mucocutaneous bleeding including heavy menstrual bleeding • Epistaxis • Easy bruising • Prolonged bleeding from minor wounds and the oral cavity • Gastrointestinal bleeding • Bleeding after dental work, childbirth, and surgery • Musculoskeletal bleeding in severe cases <p>Persons with type 1, 2A, 2M and 2N VWD may be treated with desmopressin (DDAVP Injection or Stimate Nasal Spray) if they have been shown by a DDAVP trial to be responsive. Response to DDAVP should be assessed one and four hours after DDAVP; the one-hour assessment is particularly important for patients suspected of having type 1 C VWD. A desmopressin response requires an increase of at least greater than 2 times the baseline VWF activity level and a sustained increase of both VWF and Factor VIII:C levels greater than 0.50 IU/mL for at least 4 hours.(33)</p> <p>Persons with type 2B and type 3 VWD and those with type 1, 2A, 2M, and 2N who have been shown to be nonresponsive to DDAVP, should be treated with a Factor VIII/VWF concentrate that is known to contain the higher molecular weight multimers of von Willebrand Factor and that has been virally attenuated to eliminate transmission of HIC and hepatitis A, B, and C.(33)</p> <p>In patients with VWD with a history of major and frequent bleeds, the American Society of Hematology (ASH), the International Society for Thrombosis and Haemostasis (ISTH), the National Hemophilia Foundation (NHF), and the World Federation of Hemophilia (WFH) guideline panel suggests using long-term prophylaxis with Factor replacement rather than no prophylaxis. Prophylaxis in VWD is defined as a period of at least 3 months of treatment of VWF concentrate at least once weekly, or for women with heavy menstrual bleeding, the use of VWF concentrate at least once per menstrual cycle.(33)</p> <p>Prior to surgery in a patient with VWD, consultation should be obtained with a pediatric or adult hematologist who specializes in the management of individuals with inherited bleeding disorders. This consultation should cover risk of bleeding with procedure and duration of risk. Treatment plan should be developed including such issues as the need for a DDAVP trial; type of fluid replacement or fluid restriction; dose and duration of DDAVP to be used; appropriate dose, timing, and duration of factor replacement therapy; and use of adjunctive medications (antifibrinolytics and topical agents). The ASH ISRH NHF WFH 2021 guidelines on the management of VWD conditionally recommend that desmopressin should not be used for major surgery and factor replacement should contain both FVIII and VWF activity levels of 0.50 IU/mL for at least 3 days after surgery.(33)</p>
Pain	<p>People with bleeding disorders experience both acute and chronic pain associated with bleeding. Bleeding into soft tissues and joints, whether spontaneous or associated with trauma, often causes acute pain. Repeated bleeding events over time can lead to long-term changes in affected tissues, particularly joints. Chronic arthropathy causes disability and reduces quality of life due to chronic pain.(31)</p>

	<p>Nonpharmacologic therapy and nonopioid pharmacologic therapy are preferred for chronic pain in patients with bleeding disorders. Non-steroidal anti-inflammatory drugs (NSAIDs) should typically be avoided in patients with bleeding disorders, particularly higher doses over extended durations, due to risks of potential short-term interference with platelet function and of GI ulcer formation. Selective COX-2 inhibitors (e.g., celecoxib) appear to be associated with decreased risk of anti-platelet effects and ulcer formation when compared to NSAIDs and may be considered.(31)</p>
<p>Safety(1-18,34)</p>	<ul style="list-style-type: none"> • Advate is contraindicated in: <ul style="list-style-type: none"> • Patients who have life-threatening hypersensitivity reactions, including anaphylaxis, to mouse or hamster protein or other constituents of the product (mannitol, trehalose, sodium chloride, histidine, Tris, calcium chloride, polysorbate 80, and/or glutathione) • Adynovate is contraindicated in: <ul style="list-style-type: none"> • Patients who have had prior anaphylactic reaction to Adynovate, the parent molecule (Advate), mouse or hamster protein, or excipients of Adynovate • Afstyla is contraindicated in: <ul style="list-style-type: none"> • Patients who have had life-threatening hypersensitivity reactions, including anaphylaxis to Afstyla or its excipients, or hamster proteins • Alphanate is contraindicated in <ul style="list-style-type: none"> • Patients who have manifested life-threatening immediate hypersensitivity reactions, including anaphylaxis, to the product of its components • Altuviio is contraindicated in: <ul style="list-style-type: none"> ○ Patients who have had severe hypersensitivity reactions, including anaphylaxis, to Altuviio or excipients of Altuviio • Eloctate is contraindicated in: <ul style="list-style-type: none"> • Patients who have had life-threatening hypersensitivity reactions, including anaphylaxis, to Eloctate or excipients of Eloctate (sucrose, sodium chloride, L-histidine, calcium chloride and polysorbate 20) • Esperoct is contraindicated in: <ul style="list-style-type: none"> • Patients who have known hypersensitivity to Esperoct or its components, including hamster protein • Hemofil M is contraindicated in: <ul style="list-style-type: none"> • Patients with a known hypersensitivity to the active substance, to excipients, or to mouse proteins • Humate-P is contraindicated in: <ul style="list-style-type: none"> • Anaphylactic or severe systemic reaction to antihemophilic factor or VWF preparations • Jivi is contraindicated in: <ul style="list-style-type: none"> • Patients who have a history of hypersensitivity reactions to the active substance, polyethylene glycol (PEG), mouse or hamster proteins, or other constituents of the product • Koāte is contraindicated in: <ul style="list-style-type: none"> • Patients who have had hypersensitivity reactions, including anaphylaxis, to Koāte or its components • Kogenate FS is contraindicated in: <ul style="list-style-type: none"> • Patients who have life-threatening hypersensitivity reactions, including anaphylaxis to mouse or hamster protein or other constituents of the product • Kovaltry is contraindicated in: <ul style="list-style-type: none"> • Patients who have history of hypersensitivity reactions to the active substance, mouse or hamster protein, or other constituents of the product • NovoEight is contraindicated in: <ul style="list-style-type: none"> • Patients who have had life-threatening hypersensitivity reactions, including anaphylaxis, to NovoEight or its components, including hamster proteins

PRIOR AUTHORIZATION CLINICAL CRITERIA FOR APPROVAL

Module	Clinical Criteria for Approval
	<p>Initial Evaluation</p> <p>Target Agent(s) will be approved when ALL of the following are met:</p> <ol style="list-style-type: none"> 1. ONE of the following: <ol style="list-style-type: none"> A. The requested agent is eligible for continuation of therapy AND ONE of the following: <div style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <p>Agents Eligible for Continuation of Therapy</p> <p>All target agents are eligible for continuation of therapy</p> </div> 1. Information has been provided that indicates the patient has been treated with the requested agent (starting on samples is not approvable) within the past 90 days OR 2. The prescriber states the patient has been treated with the requested agent (starting on samples is not approvable) within the past 90 days AND is at risk if therapy is changed OR B. The patient has a diagnosis of hemophilia A (also known as Factor VIII deficiency or classic hemophilia) AND ONE of the following: <ol style="list-style-type: none"> 1. The patient is currently experiencing a bleed AND BOTH of the following: <ol style="list-style-type: none"> A. The patient is out of medication AND

Module	Clinical Criteria for Approval
	<p>B. The patient needs to receive a ONE TIME emergency supply of medication OR</p> <p>2. ALL of the following:</p> <p>A. The requested agent is FDA approved or compendia supported for a diagnosis of hemophilia A AND</p> <p>B. The requested agent is being used for ONE of the following:</p> <ol style="list-style-type: none"> 1. Prophylaxis AND the patient will NOT be using the requested agent in combination with Hemlibra (emicizumab-kxwh) OR 2. As a component of Immune Tolerance Therapy (ITT)/Immune Tolerance Induction (ITI) AND BOTH of the following: <ol style="list-style-type: none"> A. The patient will NOT be using the requested agent in combination with Hemlibra (emicizumab-kxwh) AND B. ONE of the following: <ol style="list-style-type: none"> 1. The patient has NOT had more than 33 months of ITT/ITI therapy OR 2. Information has been provided supporting the continued use of ITT/ITI therapy (i.e., the patient has had a greater than or equal to 20% decrease in inhibitor level over the last 6 months and needs further treatment to eradicate inhibitors) OR 3. On-demand use for bleeds OR 4. Peri-operative management of bleeding AND <p>C. If the client has a preferred agent(s), then ONE of the following:</p> <ol style="list-style-type: none"> 1. The requested agent is a preferred agent OR 2. The patient has tried and had an inadequate response to ALL of the preferred agent(s) OR 3. The patient has an intolerance or hypersensitivity to ALL of the preferred agent(s) OR 4. The patient has an FDA labeled contraindication to ALL preferred agents OR <p>C. The patient has a diagnosis of von Willebrand disease (VWD) AND ALL of the following:</p> <ol style="list-style-type: none"> 1. The requested agent is FDA approved or compendia supported for a diagnosis of von Willebrand disease AND 2. ONE of the following: <ol style="list-style-type: none"> A. The patient is currently experiencing a bleed AND BOTH of the following: <ol style="list-style-type: none"> 1. The patient is out of medication AND 2. The patient needs to receive a ONE TIME emergency supply of medication OR B. The patient has type 1, 2A, 2M or 2N VWD AND ONE of the following: <ol style="list-style-type: none"> 1. The patient has tried and had an inadequate response to desmopressin (e.g., DDAVP injection, Stimate nasal spray) OR 2. The patient did not respond to a DDAVP trial with 1 and 4 hour post infusion bloodwork OR 3. The patient has an intolerance or hypersensitivity to desmopressin OR 4. The patient has an FDA labeled contraindication to desmopressin OR 5. The prescriber has provided information supporting why the patient cannot use desmopressin (e.g., shortage in marketplace) OR C. The patient has type 2B or 3 VWD AND 3. The requested agent will be used for ONE of the following: <ol style="list-style-type: none"> A. Prophylaxis AND ONE of the following:

Module	Clinical Criteria for Approval
	<ol style="list-style-type: none"> 1. The requested agent is Vonvendi AND ONE of the following: <ol style="list-style-type: none"> A. The patient has severe Type 3 VWD OR B. The patient has another subtype of VWD AND the subtype is FDA approved for prophylaxis use OR 2. The requested agent is NOT Vonvendi OR <ol style="list-style-type: none"> B. On-demand use for bleeds OR C. Peri-operative management of bleeding AND 4. If the client has a preferred agent(s), then ONE of the following: <ol style="list-style-type: none"> A. The requested agent is a preferred agent OR B. The patient has tried and had an inadequate response to ALL of the preferred agent(s) OR C. The patient has an intolerance or hypersensitivity to ALL of the preferred agent(s) OR D. The patient has an FDA labeled contraindication to ALL preferred agents AND 2. ONE of the following: <ol style="list-style-type: none"> A. The patient's age is within FDA labeling for the requested indication for the requested agent OR B. The prescriber has provided information in support of using the requested agent for the patient's age for the requested indication AND 3. The prescriber is a specialist in the area of the patient's diagnosis [e.g., prescriber working in a hemophilia treatment center (HTC), hematologist with hemophilia experience] or the prescriber has consulted with a specialist in the area of the patient's diagnosis AND 4. ONE of the following: <ol style="list-style-type: none"> A. The patient will NOT be using the requested agent in combination with a nonsteroidal anti-inflammatory agent (NSAID) (e.g., aspirin, ibuprofen) other than cyclooxygenase-2 (COX-2) inhibitors (e.g., celecoxib) NOTE: for the purposes of this criteria COX-2 inhibitors will be accepted for concomitant use OR B. The prescriber has provided information in support of using an NSAID for this patient AND 5. The patient does NOT have any FDA labeled contraindications to the requested agent AND 6. The prescriber must provide the actual prescribed dose with ALL of the following: <ol style="list-style-type: none"> A. Patient's weight AND B. Intended use/regimen: (e.g., prophylaxis, ITT/ITI, on-demand, peri-operative) AND C. If the patient has a diagnosis of hemophilia A BOTH of the following: <ol style="list-style-type: none"> 1. Severity of the factor deficiency (i.e., severe is less than 1% factor activity, moderate is greater than or equal to 1 to less than or equal to 5% factor activity, mild is greater than 5 to 40% factor activity) AND 2. Inhibitor status AND 7. ONE of the following: <ol style="list-style-type: none"> A. The patient will NOT be using the requested agent in combination with another agent in the same category (e.g., Factor VIII agents, Factor VIII and von Willebrand Factor combination agents) included in this program OR B. Information has been provided supporting the use of more than one unique agent in the same category (medical records required) AND 8. ONE of the following: <ol style="list-style-type: none"> A. The requested quantity (dose) does NOT exceed the program quantity limit defined by BOTH of the following: <ol style="list-style-type: none"> 1. The requested dose is within the FDA labeled dosing AND 2. The requested quantity (number of doses) is appropriate based on intended use (e.g., prophylaxis, ITT/ITI, on-demand) OR B. The prescriber has provided clinical reasoning for exceeding the defined program quantity limit (dose and/or number of doses) (medical records required)

Module	Clinical Criteria for Approval
	<p>Compendia Allowed: AHFS, or DrugDex 1 or 2a level of evidence</p> <p>Length of Approval: One time emergency use: up to 2 weeks Peri-operative dosing: 1 time per request On-demand: up to 3 months Prophylaxis: up to 6 months ITT/ITI: up to 6 months</p> <p>Renewal Evaluation</p> <p>Target Agent(s) will be approved when ALL of the following are met:</p> <ol style="list-style-type: none"> 1. The patient has been previously approved for the requested agent through the plan’s Medical Drug Review process (if current request is for ONE TIME emergency use or if patient ONLY has previous approval(s) for emergency use, must use Initial Evaluation) AND 2. If the patient is using the requested agent for prophylaxis, then ONE of the following: <ol style="list-style-type: none"> A. The patient has a diagnosis of hemophilia A AND the patient will NOT be using the requested agent in combination with Hemlibra (emicizumab-kxwh) OR B. The patient has another diagnosis AND 3. The prescriber is a specialist in the area of the patient’s diagnosis [e.g., prescriber working in a hemophilia treatment center (HTC), hematologist with hemophilia experience] or the prescriber has consulted with a specialist in the area of the patient’s diagnosis AND 4. ONE of the following: <ol style="list-style-type: none"> A. The patient will NOT be using the requested agent in combination with a nonsteroidal anti-inflammatory agent (NSAID) (e.g., aspirin, ibuprofen) other than cyclooxygenase-2 (COX-2) inhibitors (e.g., celecoxib) NOTE for the purposes of this criteria COX-2 inhibitors will be accepted for concomitant use OR B. The prescriber has provided information in support of using an NSAID for this patient AND 5. The patient does NOT have any FDA labeled contraindications to the requested agent AND 6. The prescriber must provide the actual prescribed dose with ALL of the following: <ol style="list-style-type: none"> A. Patient’s weight AND B. Intended use/regimen: (e.g., prophylaxis, ITT/ITI, on-demand, peri-operative) AND C. If the patient has a diagnosis of hemophilia A BOTH of the following: <ol style="list-style-type: none"> 1. Severity of the factor deficiency (i.e., severe is less than 1% factor activity, moderate is greater than or equal to 1 to less than or equal to 5% factor activity, mild is greater than 5 to 40% factor activity) AND D. Inhibitor status AND 7. ONE of the following: <ol style="list-style-type: none"> A. The prescriber communicated with the patient (via any means) regarding the frequency and severity of the patient’s bleeds and has verified that the patient does not have greater than 5 on-demand doses on hand OR B. The prescriber has provided information in support of the patient having more than 5 on-demand doses on hand AND 8. ONE of the following: <ol style="list-style-type: none"> A. The patient will NOT be using the requested agent in combination with another agent in the same category (e.g., Factor VIII agents, Factor VIII and von Willebrand Factor combination agents) included in this program OR B. Information has been provided supporting the use of more than one unique agent in the same category (medical records required) AND 9. If the patient is using Immune Tolerance Therapy (ITT)/Immune Tolerance Induction (ITI), then ONE of the following: <ol style="list-style-type: none"> A. The patient has NOT had more than 33 months of ITT/ITI therapy OR
